LAB 4

TASK 1: Demonstration of Attachment-Based Phishing attack

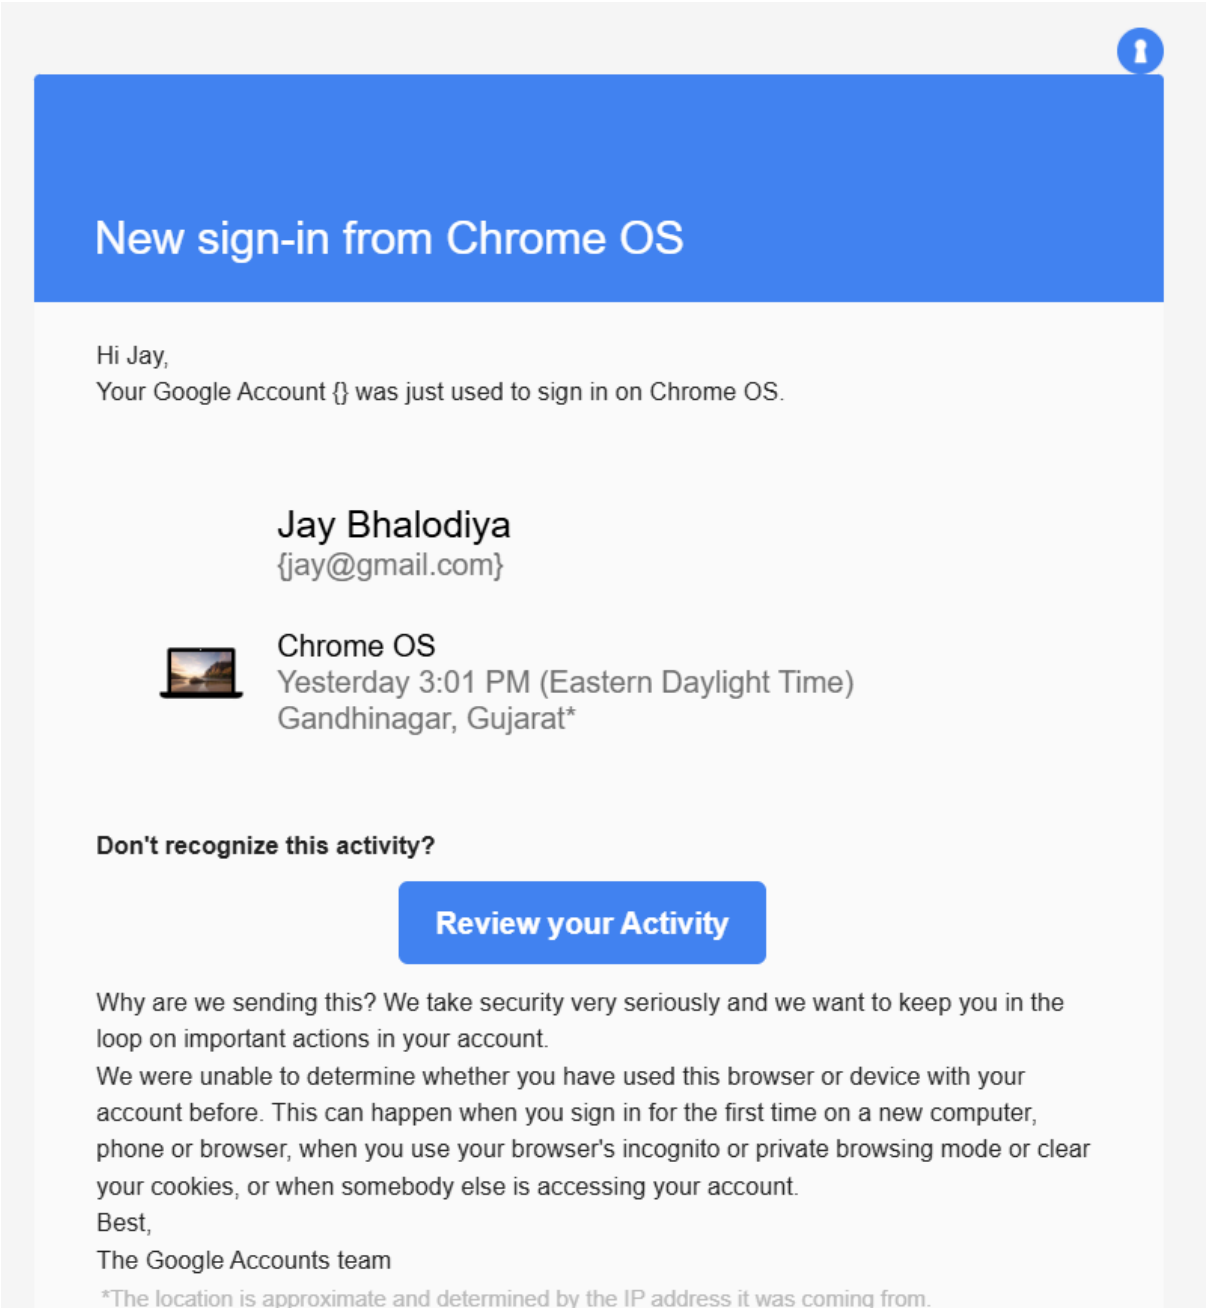

I opened Google Docs and created a document.I opened the Extensions section and selected Apps Script and added script given below that displays a pop-up (alert) message when the document is opened and saved it. I reloaded the document and shared it with another user with edit access. When the shared document was opened the script executed and displayed the message “You got hacked ! Pay 0.00001 BTC to get AppKey”. This helped me understand how embedded scripts in shared documents can be used to demonstrate the behavior of phishing-based attacks.

TASK 2: Demonstration of Credential Harvesting attack

I ran the below html code for the new sign-in code

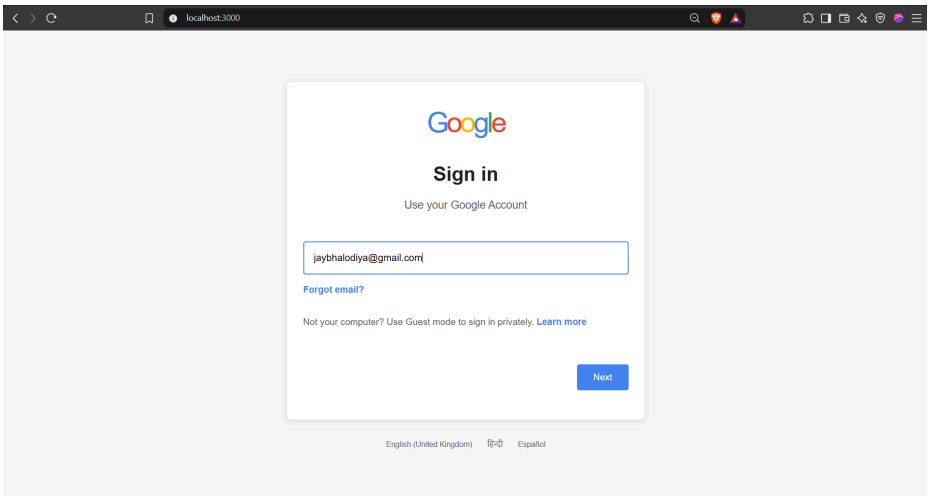

I created a new project and set up the node js environment and a new mongo db cluster named cluster0.

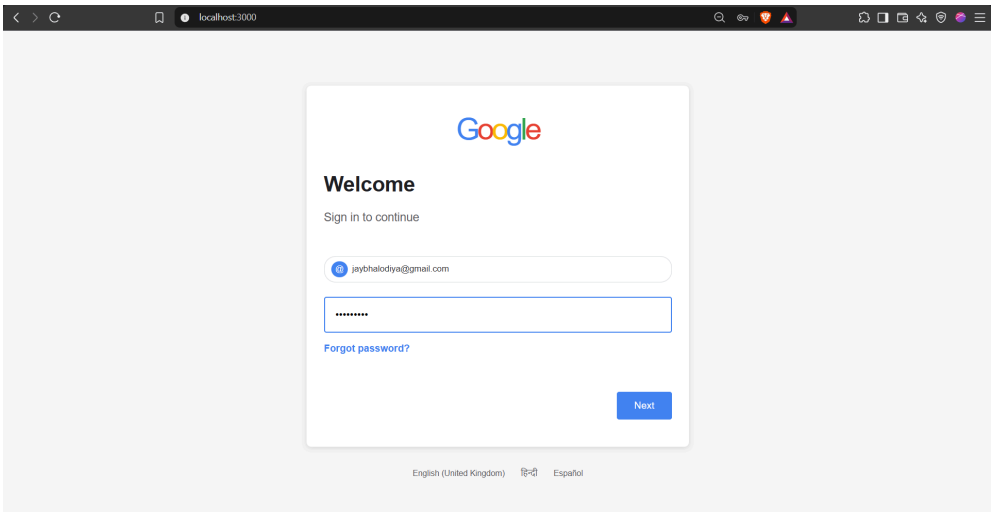

The github link for the project:
https://github.com/jaybhalodiya10/CS445_cyberANDsoftware/tree/main/lab4

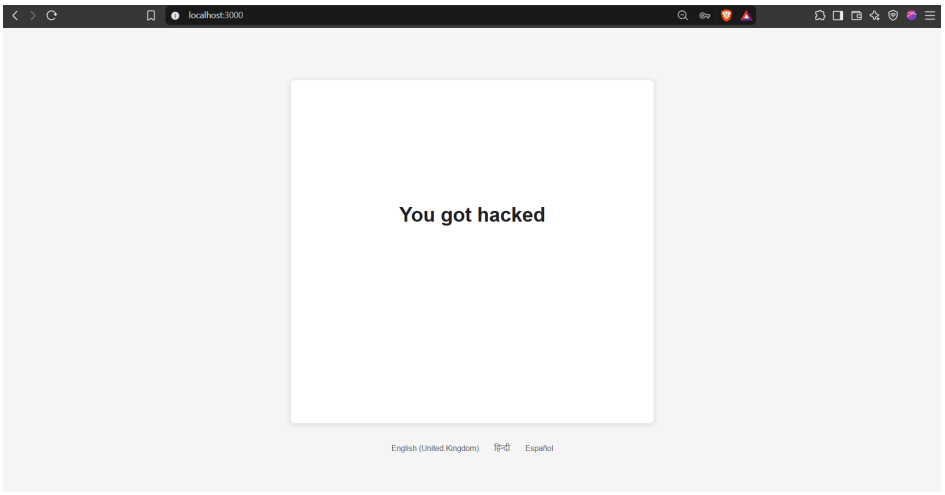

Then I created index.html and server.js file and then coded it to retrieve the frontend email and password entered by user and store it to the MongoDb cluster with the url :

```
mongodb+srv://202351049_db_user:jb202351049@cluster0.32ckfvu.mongodb.net/?appName=Cluster0
```

After running the server.js , I tested it by entering the email and password on the http://localhost:3000/ to see where i get the values in my mongo db cluster

Then i checked the mongo db data overview collection to see the value stored:
